Commissioner for Patents App. No. 09/660,026 Nov. 22, 2004 Page 2 of 8

## IN THE CLAIMS:

1. (Currently amended) A method performed by a data processing system having a memory, comprising the steps of:

simulating an execution of an assignment statement of a hardware description language design specification in order to determine a logical value for a target signal of the assignment statement based upon a set of logical values for a set of input signals to the assignment statement;

identifying a subset of the input signals having an observably controllable effect on the logical value of the target signal based upon the logical values of the input signals and a functional interrelation of the input signals; and

determining a target tag value for the target signal comprising an identifier of the assignment statement and a history comprised of a propagation of a tag value of each input signal that is a member of the subset of input signals.

2. (original) The method of claim 1, wherein:

the step of identifying further comprises identifying a second subset of a set of input signals to a conditional statement of the hardware description language design specification having an observably controllable effect upon whether the assignment statement is simulated, membership in the second subset being based upon a logical value for each of an input signal to the conditional statement and a functional interrelation of the input signals to the conditional statement; and

the step of determining further comprises determining the history to be additionally comprised of a propagation of a tag value of each signal of the second subset.

3. (original) The method of claim 1, wherein:

the step of identifying further comprises identifying a second subset of a set of input signals to a conditional expression of a conditional statement of the hardware

Commissioner for Patents App. No. 09/660,026 Nov. 22, 2004 Page 3 of 8

description language design specification having an observably controllable effect upon whether the conditional expression is satisfied; and

the step of determining further comprises determining the history to be additionally comprised of a propagation of a tag value of each signal of the second subset.

- 4. (original) The method of claim 1, wherein a propagation of a tag value to the history is comprised of creating a copy of the tag value.
- 5. (original) The method of claim 2, wherein a propagation of a tag value to the history is comprised of creating a copy of the tag value.
- 6. (original) The method of claim 3, wherein a propagation of a tag value to the history is comprised of creating a copy of the tag value.
- 7. (original) The method of claim 1, wherein:

the method further comprises the step of propagating the target tag value from the target signal, within a module instantiation comprising the assignment statement, to a higher-level signal of the hardware description language design specification.

- 8. (original) The method of claim 7, wherein the step of propagating is performed in response to determining the logical value for the target signal.
- 9. (original) The method of claim 7, wherein the target signal is defined as an output signal of the module instantiation.
- 10. (Previously presented) The method of claim 7, wherein the propagation of the target tag value is performed by creating a copy of the target tag value.
- 11. (original) The method of claim 1, wherein:

Commissioner for Patents App. No. 09/660,026 Nov. 22, 2004 Page 4 of 8

the method further comprises the step of propagating the target tag value from the target signal, at a higher-level than a module instantiation of the hardware description language design specification, to a lower-level signal of the module instantiation.

- 12. (original) The method of claim 11, wherein the step of propagating is performed in response to determining the logical value for the target signal.
- 13. (original) The method of claim 11, wherein the lower-level signal is defined as an input signal of the module instantiation.
- 14. (Previously presented) The method of claim 11, wherein the propagation of the target tag value is performed by creating a copy of the target tag value.
- 15. (original) The method of claim 1, wherein observable controllability of a first input signal is determined by determining whether a flipping of a first logical value of the first input signal will cause a flipping of the logical value of the target signal.
- 16. (original) The method of claim 1, wherein observable controllability of a first intermediate output signal of a first sub-function, wherein the functional interrelation of the input signals is comprised of the first sub-function, is determined by a rule-based consideration of the first sub-function and of a logical value for each input of the first sub-function.
- 17. (original) The method of claim 16, wherein a logical value of the first sub-function is the same logical value assigned to the target signal.
- 18. (original) The method of claim 16, wherein an input signal of the first sub-function is an input signal of the assignment statement.

- 19. (original) The method of claim 1, wherein the target tag value is further comprised of a field for indicating a subsequent assignment statement that utilizes the target tag value.
- 20. (Currently amended) A data processing system having a memory, comprising the following:

a sub-system for simulating an execution of an assignment statement of a hardware description language design specification in order to determine a logical value for a target signal of the assignment statement based upon a set of logical values for a set of input signals to the assignment statement;

a sub-system for identifying a subset of the input signals having an observably controllable effect on the logical value of the target signal based upon the logical values of the input signals and a functional interrelation of the input signals; and

a sub-system for determining a target tag value for the target signal comprising an identifier of the assignment statement and a history comprised of a propagation of a tag value of each input signal that is a member of the subset of input signals.

21. (Currently amended) A computer program product comprising:
a computer usable medium having computer readable code embodied therein;
computer readable program code devices configured to cause a computer to
effect simulating an execution of an assignment statement of a hardware description
language design specification in order to determine a logical value for a target signal of
the assignment statement based upon a set of logical values for a set of input signals to
the assignment statement;

computer readable program code devices configured to cause a computer to effect identifying a subset of the input signals having an observably controllable effect on the logical value of the target signal based upon the logical values of the input signals and a functional interrelation of the input signals; and

computer readable program code devices configured to cause a computer to effect determining a target tag value for the target signal comprising an identifier of the
